ContiTech® Timing Kits Problem Solvers Address Key Service Issues

Cranbury, N.J., October, 2011 - ContiTech Pro Series Plus Timing Kits solve special service problems by providing technicians with all of the components needed to perform a proper timing belt and water pump service.

Unlike the competition, CRP also includes additional components to

help technicians handle specific application issues.

Some water pumps use a plastic impeller and are very prone to failure. CRP offers techs a choice by providing kits with either an OE style plastic or a more robust metal impeller. Certain water water pump housing have corrosion issues, making pump replacement very difficult and costly. For these applications, CRP offers kit

versions that include a new water pump housing, so technicians have the rigth part when they need it.

Sealing the deal

ContiTech Pro Series Plus kits also include cam and balance shaft seals. CRP uses seals that match <u>all</u> of the OE specs for ID, OD, and width, unlike competitors who use a generic seal that only matches ID and OD. In certain Audi/VW applications, CRP offers kit versions with a traditional camshaft seals that have a spring on the inner lip or the new style seals without a spring.

ContiTech Pro Series Plus kits are built around the genuine, OE-quality ContiTech® timing belt and include the waterpump, cam and balance shaft seals, and the hydraulic damper, when needed and packaged to the exact specifications for the vehicle. All components are sourced from OE-quality suppliers and covered by a warranty that matches the original manufacturer's belt replacement interval.

Editor note: CRP Automotive successfully pioneered the development of timing belt service kits and leads the aftermarket with the most comprehensive program on the market.
